

4. Multiple if

--> If you have more than one if then it is called as multiple if

Ex:

```

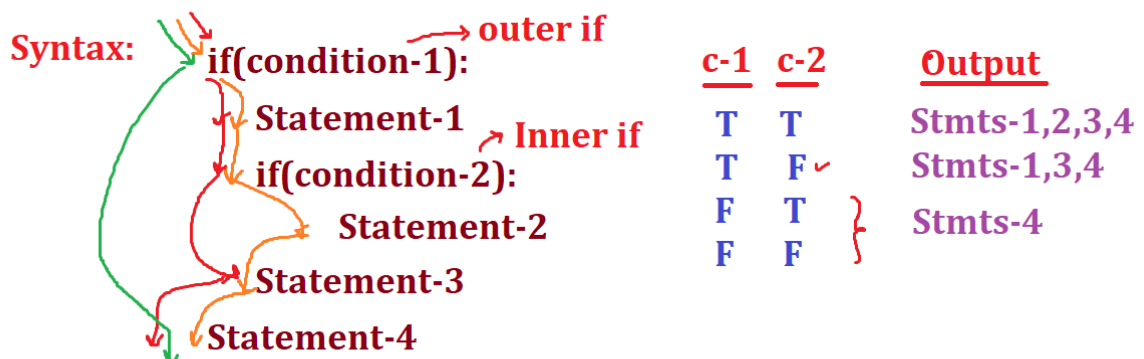

n = 5
if n >= 3:
    n = n + 5
if n >= 7:
    n = n - 2
print(n)
    
```

n
5
~~10~~
8

Output: 8

5. Nested if

--> A if inside of another if is called as nested if

Note: In case outer if is False then control never check inner if

--> W.a.p to read a number, if it is not a zero then only check given number is +Ve number or -ve number

```

n = int(input('Enter any Number : '))
if n != 0:
    if n > 0:
        print('+Ve Number')
    else:
        print('-Ve Number')
else:
    print('Given Number is Zero')
    
```

-->W.a.p to read age of a person,
if it is +Ve number then only check person is Eligible for vote or not
Otherwise display message as 'Invalid Age'

```
age = int(input('Enter your age : '))
if age>0:
    if age>=18:
        print('Eligible for Vote')
    else:
        print('Not Eligible for vote')
else:
    print('Invalid Age')
```

-->W.a.p to read a number from 1-3 only, check n value is b/w 1-3 or not
if yes then print in word format

1 - One
2 - Two
3 - Three

Otherwise print message as 'Invalid Choice'

```
n = int(input('Enter any Number : '))
if n>=1 and n<=3:
    if n==1:
        print('ONE')
    elif n==2:
        print('Two')
    else:
        print('Three')
else:
    print('Invalid Choice')
```

Task1:

1. Idly - 60.0
2. Dosa - 100.0
3. Vada - 80.0
4. Puri - 120.0

Enter your choice : 2

Dosa Cost is : 100.0

Enter Quantity : 3

Bill Amount is : 300.0

Enter your choice : 6

Invalid Choice

Python Notes by AVD Group

```
print('1. Idly - 60.0')
print('2. Dosa - 100.0')
print('3. Vada - 80.0')
print('4. Puri - 120.0')
ch = int(input('Enter your choice : '))
if ch>=1 and ch<=4:
    if ch==1: ✓
        itemname='Idly' }
        cost = 60.0
    elif ch==2:
        itemname='Dosa' }
        cost = 100.0
    elif ch==3:
        itemname='Vada'
        cost= 80.0
    else:
        itemname='Puri'
        cost = 120.0
→ print(f'{itemname} cost is : {cost}')          vada cost is : 80.0 ✓
    qty = int(input('Enter Quantity : '))
    billAmt = cost * qty
    print(f'Bill Amount is {billAmt}')
else:
    print('Invalid Choice')
```

Task2:

1. Idly - 60.0
2. Dosa - 100.0
3. Vada - 80.0
4. Puri - 120.0

Enter your choice : 2
Dosa Cost is : 100.0
Enter Quantity : 3
Bill Amount is : 300.0

SGST(2.5%) : 7.5
Total Bill is : 315.0
Paid Amount : 500.0
Balance is : 185.0

Enter your choice : 6
Invalid Choice

CGST(2.5%) --> billAmt * cgst/100 --> 300*2.5/100

Task3:

1. Idly - 60.0
2. Dosa - 100.0
3. Vada - 80.0
4. Puri - 120.0

Enter your choice : 2
1. Plain Dosa - 100.0
2. Onion Dosa - 120.0
3. Masala Dosa - 140.0
Enter your choice : 2
Onion Dosa Cost is : 120.0
Enter quantity : 3
Bill Amount is : 360.0

Looping Statements

--> If you want to execute certain statements multiple times then use looping statements

--> If you know number of iterations then use for-loop

--> If you don't know number of iterations, but you need to execute multiple times based on condition then use while loop

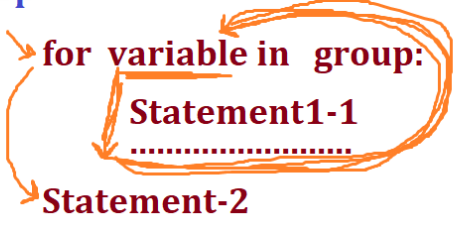

for loop

--> for loop we can use in 2 ways

1. Based on group of elements
2. Based on range(-,-,-) function

for loop Based on group of elements

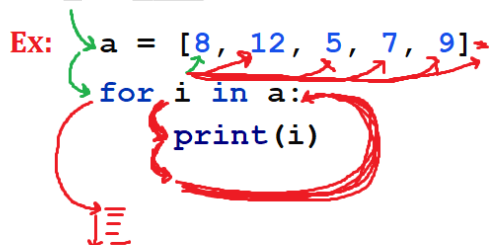

--> In a group of elements, if you want to bring elements one by one then use for loop

Syntax: 

Ex: Consider a = [8, 5, 15, 12, 9], Now print elements one by one

```
a = [8, 5, 15, 12, 9]
for i in a:
    print(i)
print('Thank you')
```

Flow

Ex: 

i
8
12
5
7
9

8
12
5
7
9

a ---->
